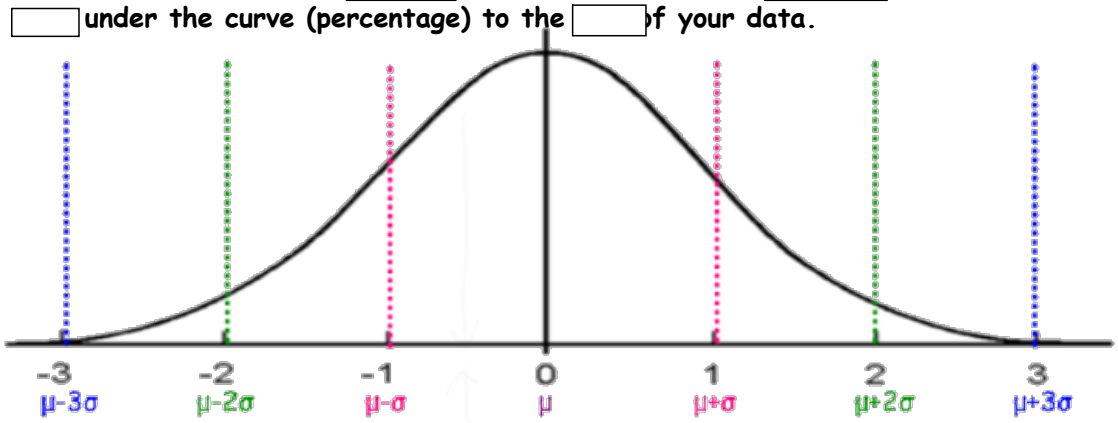
Z-scores

The [ ] of standard deviations from the mean is also called the "[ ] Score", "[ ]" or "z-score".

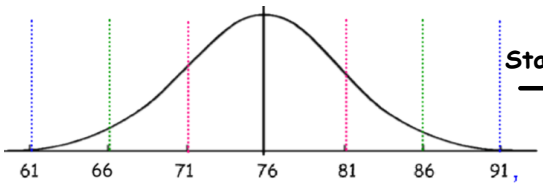
Z-score lets us find the [ ] when you are not on a [ ]. It is always the [ ] under the curve (percentage) to the [ ]f your data.



So to convert a value to a Standard Score ("z-score"):

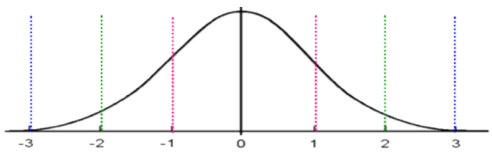
- first [ ] the mean,
- then [ ] the Standard Deviation

And doing that is called "[ ]":



A normal distribution

Standardized

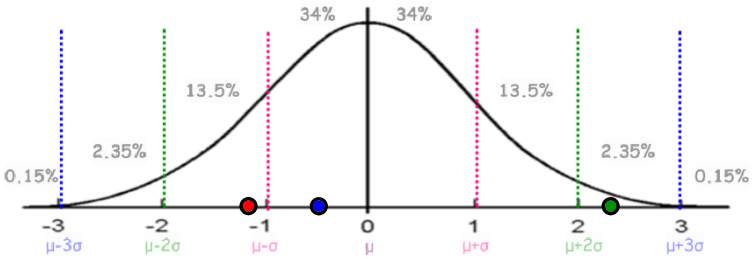


A standardized normal distribution

A survey of daily travel time had these results (in minutes):

26, 33, 65, 28, 34, 55, 25, 44, 50, 36, 26, 37, 43, 62, 35, 38, 45, 32, 28, 34

The Mean is 38.8 minutes, and the Standard Deviation is 11.4 minutes.



Convert the values to z-scores ("standard scores"). I've set up some for you but you need to finish all the rest on your own.

(26-38.8)/11.4= ____ (34-38.8)/11.4=

(33-38.8)/11.4= ____ (55-38.8)/11.4=

(65-38.8)/11.4= ____ (25-38.8)/11.4=

(28-38.8)/11.4= (44-38.8)/11.4=

Using the Z-Score Chart

Use this chart to find the ____ under a normal curve when finding the percentage. Remember this is like a ____. It gives you percentage to the ____ side of the z-score.

Negative z-score - value is to the ____ of the mean.

Positive z-score - value is to the ____ of the mean
